

Chapter 3

Introduction to HTML5:

Part 2

Internet & World Wide Web
How to Program, 5/e

OBJECTIVES

In this chapter you'll:

- Build a form using the new HTML5 `input` types.
- Specify an `input` element in a form as the one that should receive the focus by default.
- Use self-validating `input` elements.
- Specify temporary `placeholder` text in various `input` elements
- Use `autocomplete` `input` elements that help users re-enter text that they've previously entered in a form.
- Use a `datalist` to specify a list of values that can be entered in an `input` element and to autocomplete entries as the user types.
- Use HTML5's new page-structure elements to delineate parts of a page, including headers, sections, figures, articles, footers and more.

3.1 Introduction

3.2 New HTML5 Form input Types

- 3.2.1 input Type color
- 3.2.2 input Type date
- 3.2.3 input Type datetime
- 3.2.4 input Type datetime-local
- 3.2.5 input Type email
- 3.2.6 input Type month
- 3.2.7 input Type number
- 3.2.8 input Type range
- 3.2.9 input Type search
- 3.2.10 input Type tel
- 3.2.11 input Type time
- 3.2.12 input Type url
- 3.2.13 input Type week

3.3 input and datalist Elements and autocomplete Attribute

3.3.1 `input` Element `autocomplete` Attribute

3.3.2 `datalist` Element

3.3 Page-Structure Elements

3.4.1 `header` Element

3.4.2 `nav` Element

3.4.3 `figure` Element and `figcaption` Element

3.4.4 `article` Element

3.4.5 `summary` Element and `details` Element

3.4.6 `section` Element

3.4.7 `aside` Element

3.4.8 `meter` Element

3.4.9 `footer` Element

3.4.10 Text-Level Semantics: `mark` Element and `wbr` Element

3.1 New HTML5 Form input Types

- ▶ Figure 3.1 demonstrates HTML5's new form input types.
- ▶ These are not yet universally supported by all browsers.

```
1 <!DOCTYPE html>

96             <input type = "week" />
97                 (yyyy-Wnn, such as 2012-W01)
98         </label>
99     </p>
100    <p>
101        <input type = "submit" value = "Submit" />
102        <input type = "reset" value = "Clear" />
103    </p>
104    </form>
105  </body>
106 </html>
```

Fig. 3.1 | New HTML5 form input types and attributes. (Part 5 of 5.)

3.1.1 input Type color

- ▶ The **color input type** enables the user to enter a color.
- ▶ At the time of this writing, most browsers render the color input type as a text field in which the user can enter a hexadecamal code or a color name.
- ▶ In the future, when you click a color input, browsers will likely display a *color picker* similar to the Microsoft Windows color dialog shown in Fig. 3.2.

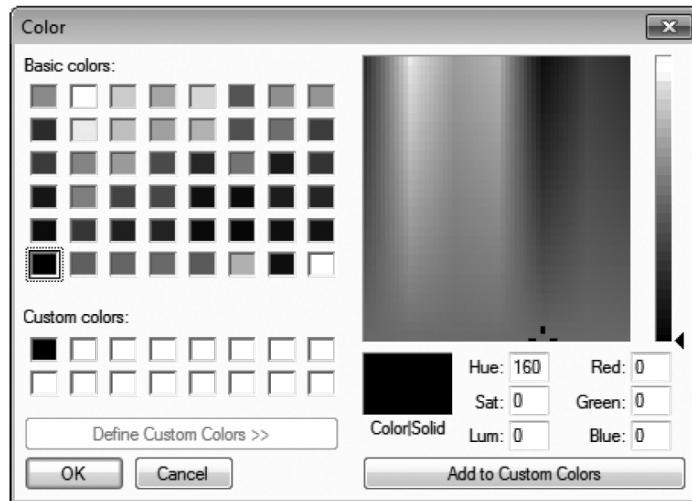

Fig. 3.2 | A dialog for choosing colors.

3.1.1 `input Type color`

autofocus Attribute

- ▶ The `autofocus` attribute—an optional attribute that can be used in only one `input` element on a form—automatically gives the focus to the `input` element, allowing the user to begin typing in that element immediately.

3.1.1 `input Type color` (cont.)

- ▶ Figure 3.3 shows autofocus on the `color` element—the first `input` element in our form—as rendered in Chrome. You do not need to include autofocus in your forms.

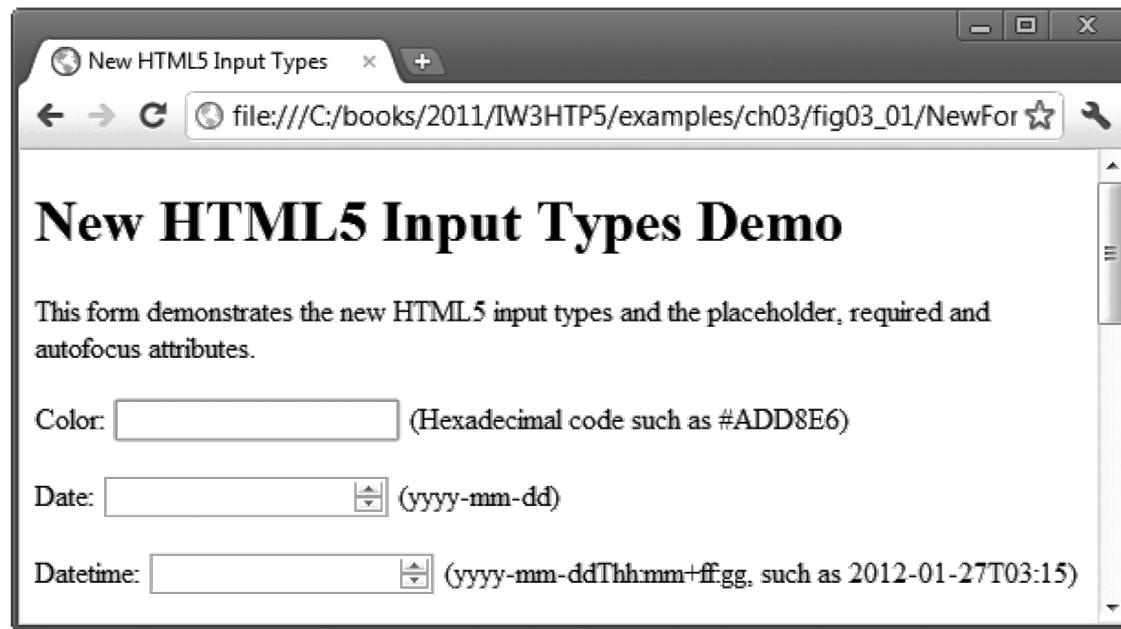

Fig. 3.3 | Autofocus in the color input element using Chrome.

3.1.1 input Type color (cont.)

Validation

- ▶ The new HTML 5 input types are *self validating* on the client side, eliminating the need to add complicated JavaScript code to your web pages to validate user input, reducing the amount of invalid data submitted and consequently reducing Internet traffic between the server and the client to correct invalid input.
- ▶ *The server should still validate all user input.*
- ▶ When a user enters data into a form then submits the form the browser immediately checks the self-validating elements to ensure that the data is correct (Fig. 3.4).

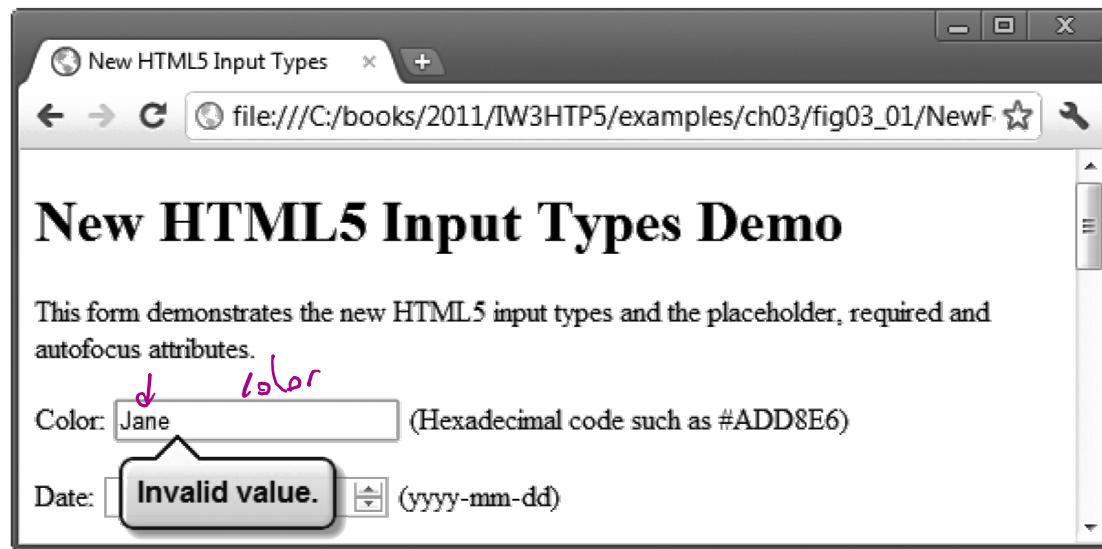

Fig. 3.4 | Validating a color input in Chrome.

3.1.1 `input` Type `color` (cont.)

- ▶ Figure 3.5 lists each of the new HTML5 `input` types and provides examples of the proper formats required for each type of data to be valid.

input type	Format
color	Hexadecimal code
date	yyyy-mm-dd
datetime	yyyy-mm-dd
datetime-local	yyyy-mm-ddThh:mm
month	yyyy-mm
number	Any numerical value
email	name@domain.com
url	http://www.domain-name.com
time	hh:mm
week	yyyy-Wnn

Fig. 3.5 | Self-validating input types.

3.1.1 input Type color (cont.)

- ▶ If you want to bypass validation, you can add the **formnovalidate** attribute to input type submit in line 101:

```
<input type = "submit" value = "Submit"  
formnovalidate />
```

3.1.2 input Type date

- ▶ The **date input type** enables the user to enter a date in the form yyyy-mm-dd.
- ▶ Firefox and Internet Explorer display a text field in which a user can enter a date such as 2012-01-27.
- ▶ Chrome and Safari display a **spinner control**—a text field with an up-down arrow () on the right side—allowing the user to select a date by clicking the up or down arrow.
- ▶ The start date is the *current date*.
- ▶ Opera displays a calendar from which you can choose a date.
- ▶ In the future, when the user clicks a date input, browsers are likely to display a date control similar to the Microsoft Windows one shown in Fig. 3.6.

input type = "date"

Fig. 3.6 | A date chooser control.

3.1.3 input Type `datetime`

- ▶ The `datetime` `input type` enables the user to enter a date (year, month, day), time (hour, minute, second, fraction of a second) and the time zone set to UTC (Coordinated Universal Time or Universal Time, Coordinated).
- ▶ Currently, most of the browsers render `datetime` as a text field; Chrome renders an up-down control and Opera renders a date and time control.

3.1.4 input Type `datetime-local`

- ▶ The `datetime-local` input type enables the user to enter the date and time in a *single* control.
- ▶ The data is entered as year, month, day, hour, minute, second and fraction of a second.
- ▶ Internet Explorer, Firefox and Safari all display a text field.
- ▶ Opera displays a date and time control.

3.1.5 `input` Type `email`

- ▶ The `email` input type enables the user to enter an e-mail address or a list of e-mail addresses separated by commas (if the `multiple` attribute is specified).
- ▶ Currently, all of the browsers display a text field.
- ▶ If the user enters an *invalid* e-mail address (i.e., the text entered is *not* in the proper format) and clicks the Submit button, a callout asking the user to enter an e-mail address is rendered pointing to the `input` element (Fig. 3.7).
- ▶ HTML5 does not check whether an e-mail address entered by the user actually exists—rather it just validates that the e-mail address is in the *proper format*.

Fig. 3.7 | Validating an e-mail address in Chrome.

input type="email"

3.1.5 `input` Type `email` (cont.)

placeholder Attribute

- ▶ The **placeholder attribute** allows you to place temporary text in a text field.
- ▶ Generally, placeholder text is *light gray* and provides an example of the text and/or text format the user should enter (Fig. 3.8).
- ▶ When the *focus* is placed in the text field (i.e., the cursor is in the text field), the placeholder text disappears—it's not “submitted” when the user clicks the Submit button (unless the user types the same text).

a) Text field with gray placeholder text

b) placeholder text disappears when the text field gets the focus

Fig. 3.8 | placeholder text disappears when the `input` element gets the focus.

3.1.5 input Type email (cont.)

- ▶ HTML5 supports placeholder text for only six input types—text, search, url, tel, email and password.

requiredAttribute

- ▶ The **required attribute** forces the user to enter a value before submitting the form.
- ▶ You can add required to any of the input types.
- ▶ In this example, the user *must* enter an e-mail address and a telephone number to submit the form (Fig. 3.9).

New HTML5 Input Types

file:///C:/books/2011/IW3HTP5/examples/ch03/fig03_01/NewForr

New HTML5 Input Types Demo

This form demonstrates the new HTML5 input types and the placeholder, required and autofocus attributes.

Color: (Hexadecimal code such as #ADD8E6)

Date: (yyyy-mm-dd)

Datetime: (yyyy-mm-ddThhmm+ffgg, such as 2012-01-27T03:15)

Datetime-local: (yyyy-mm-ddThhmm, such as 2012-01-27T03:15)

Email: (name@domain.com)

Month: Please fill out this field. (y-mm)

Fig. 3.9 | Demonstrating the required attribute in Chrome.

3.1.6 `input Type month`

- ▶ The `month input type` enables the user to enter a year and month in the format yyyy-mm, such as 2012-01.
- ▶ If the user enters the data in an improper format (e.g., January 2012) and submits the form, a callout stating that an invalid value was entered appears.

3.1.7 input Type number

- ▶ The **number input type** enables the user to enter a numerical value—mobile browsers typically display a numeric keypad for this input type.
- ▶ Internet Explorer, Firefox and Safari display a text field in which the user can enter a number. Chrome and Opera render a spinner control for adjusting the number.
- ▶ The `min` attribute sets the minimum valid number.
- ▶ The `max` attribute sets the maximum valid number.
- ▶ The `step` attribute determines the increment in which the numbers increase.
- ▶ The `value` attribute sets the initial value displayed in the form (Fig. 3.10).
- ▶ The spinner control includes only the valid numbers.
- ▶ If the user attempts to enter an invalid value by typing in the text field, a callout pointing to the number input element will instruct the user to enter a valid value.

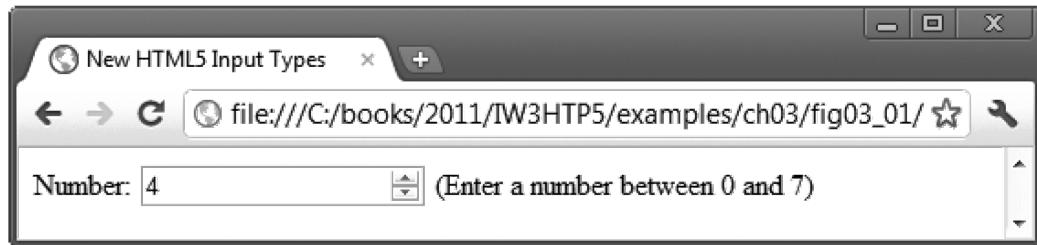

Fig. 3.10 | `input type number` with a `value` attribute of 4 as rendered in Chrome.

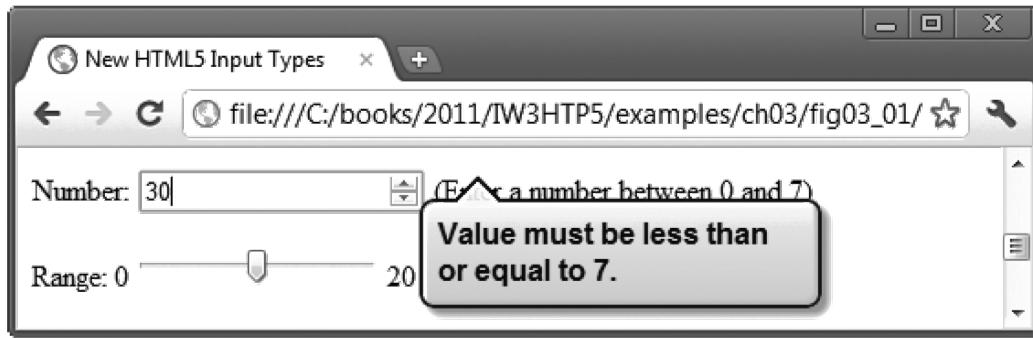

Fig. 3.11 | Chrome checking for a valid number.

3.1.8 input Type range

- ▶ The **range input type** appears as a *slider* control in Chrome, Safari and Opera (Fig. 3.12).
- ▶ You can set the minimum and maximum and specify a value.
- ▶ The range input type is *inherently self-validating* when it is rendered by the browser as a slider control, because *the user is unable to move the slider outside the bounds of the minimum or maximum value*.

Fig. 3.12 | range slider with a `value` attribute of 10 as rendered in Chrome.

3.1.9 input Type search

- ▶ The **search input type** provides a search field for entering a query.
- ▶ This input element is functionally equivalent to an input of type **text**.
- ▶ When the user begins to type in the search field, Chrome and Safari display an X that can be clicked to clear the field (Fig. 3.13).
- ▶

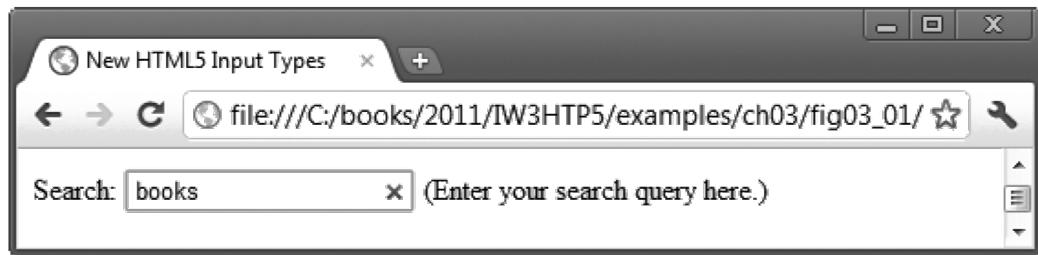

Fig. 3.13 | Entering a search query in Chrome.

3.1.10 `input Type tel`

- ▶ The `tel` input type enables the user to enter a telephone number—mobile browsers typically display a keypad specific to entering phone numbers for this input type.
- ▶ At the time of this writing, the `tel` input type is rendered as a text field in all of the browsers.
- ▶ HTML5 does *not* self validate the `tel` input type.
- ▶ To ensure that the user enters a phone number in a proper format, we've added a `pattern` attribute that uses a *regular expression* to determine whether the number is in the format:
 - (555) 555-5555
- ▶ When the user enters a phone number in the wrong format, a callout appears requesting the proper format, pointing to the `tel` input element (Fig. 3.14).
- ▶

New HTML5 Input Types

file:///C:/books/2011/IW3HTP5/examples/ch03/fig03_01/

Tel: (###) ###-####

Time: (hhmmssff)

URL:

Fig. 3.14 | Validating a phone number using the pattern attribute in the tel input type.

3.1.11 **input Type time**

- ▶ The **time input type** enables the user to enter an hour, minute, seconds and fraction of second (Fig. 3.15).
- ▶ The HTML5 specification indicates that a time must have two digits representing the hour, followed by a colon (:) and two digits representing the minute.
- ▶ Optionally, you can also include a colon followed by two digits representing the seconds and a period followed by one or more digits representing a fraction of a second (shown as ff in our sample text to the right of the time input element in Fig. 3.15).
- ▶

Fig. 3.15 | time input as rendered in Chrome.

3.1.12 `input Type url`

- ▶ The `url` input type enables the user to enter a URL.
- ▶ The element is rendered as a text field, and the proper format is `http://www.deitel.com`.
- ▶ If the user enters an improperly formatted URL (e.g., `www.deitel.com` or `www.deitelcom`), the URL will *not* validate (Fig. 3.16).
- ▶ HTML5 does not check whether the URL entered is valid; rather it validates that the URL entered is in the proper format.

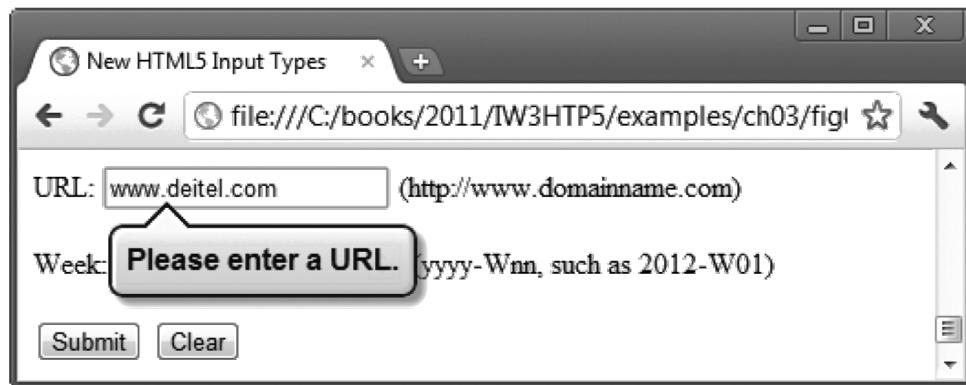

Fig. 3.16 | Validating a URL in Chrome.

3.1.13 **input Type week**

- ▶ The **week input type** enables the user to select a year and week number in the format yyyy-wnn, where nn is 01–53—for example, 2012-w01 represents the first week of 2012. Internet Explorer, Firefox and Safari render a text field.
- ▶ Chrome renders an up-down control.
- ▶ Opera renders *week control*/with a down arrow that, when clicked, brings up a calendar for the current month with the corresponding week numbers listed down the left side.

3.2 **input** and **datalist** Elements and **autocomplete** Attribute

- ▶ Figure 3.17 shows how to use the new **autocomplete** attribute and **datalist** element.

3.2.1 `input` Element `autocomplete`

Attribute

- ▶ The `autocomplete` attribute can be used on input types to automatically fill in the user's information based on previous input—such as name, address or e-mail.
- ▶ You can enable autocomplete for an entire form or just for specific elements.
- ▶ For example, an online order form might set `autocomplete = "on"` for the name and address inputs and set `autocomplete = "off"` for the credit card and password inputs for security purposes.

Error-Prevention Tip 3.1

The `autocomplete` attribute works only if you specify a name or `id` attribute for the `input` element.

3.1

3.2.2 **datalist** Element

- ▶ The **datalist element** provides input options for a text input element.
- ▶ At the time of this writing, **datalist** support varies by browser.
- ▶ In this example, we use a **datalist** element to obtain the user's birth month.
- ▶ Using Opera, when the user clicks in the text field, a drop-down list of the months of the year appears. If the user types "M" in the text field, the list on months is narrowed to March and May.
- ▶ When using Firefox, the drop-down list of months appears only after the user begins typing in the text field. If the user types "M", all months containing the letter "M" or "m" appear in the drop-down list—March, May, September, November and December.

3.3 Page-Structure Elements

- ▶ HTML5 introduces several new page-structure elements (Fig. 3.18) that meaningfully identify areas of the page as headers, footers, articles, navigation areas, asides, figures and more.
- ▶

```
1 <!DOCTYPE html>
2
3 <!-- Fig. 3.18: sectionelements.html -->

a) Chrome browser showing the `header` element and a `nav` element that contains an unordered list of links

The screenshot shows a Chrome browser window with the title "New HTML5 Section Element". The address bar displays the local file path "file:///C:/books/2011/IW3HTP5/examples/ch03/fig03_18/Section". The page content includes a logo featuring a cartoon character with arms raised, followed by the word "DEITEL". Below this is a large heading "Welcome to the Deitel Buzz Online". Underneath the heading is the date "2012-01-17". A section titled "Recent Publications" lists several books:

- [Internet & World Wide Web How to Program, 5/e](#)
- [Android for Programmers: An App-Driven Approach](#)
- [iPhone for Programmers: An App-Driven Approach](#)
- [Java How to Program, 9/e](#)
- [C++ How to Program, 8/e](#)
- [Visual C# 2010 How to Program, 4/e](#)
- [Visual Basic 2010 How to Program](#)

b) Chrome browser showing the beginning of a section containing a figure and a figurecaption

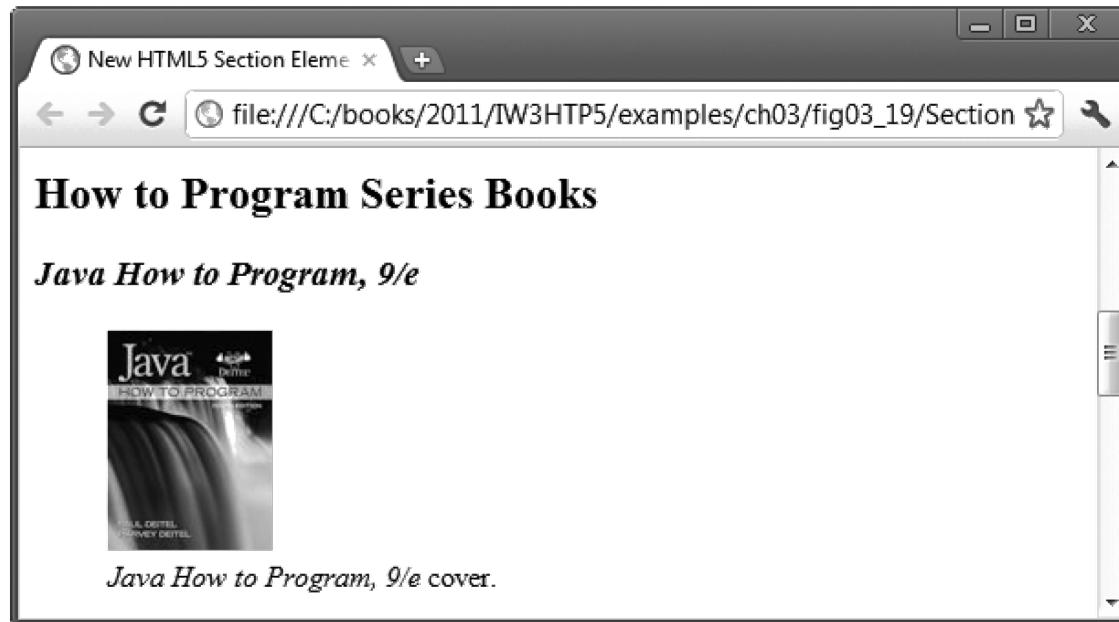

Fig. 3.18 | New HTML5 section elements. (Part 10 of 13.)

c) Chrome browser showing an **article** containing a **header**, some content and a collapsed **details** element, followed by an **aside** element

The screenshot shows a Google Chrome browser window with the title "New HTML5 Section Eleme". The address bar displays "file:///C:/books/2011/IW3HTP5/examples/ch03/fig03_19/Section". The page content is as follows:

From Java How to program, 9/e:

Features include:

- Rich coverage of fundamentals, including two chapters on control statements.
- Focus on real-world examples.
- Making a Difference exercises set.
- Early introduction to classes, objects, methods and strings.
- Integrated exception handling.
- Files, streams and object serialization.
- Optional modular sections on language and library features of the new Java SE 7.
- Other topics include: Recursion, searching, sorting, generic collections, generics, data structures, applets, multimedia, multithreading, databases/JDBC™, web-app development, web services and an optional ATM Object-Oriented Design case study.

► Recent Edition Testimonials

The aside element is not formatted by the browsers.

d) Chrome browser showing the end of the **section** that started in part (b)

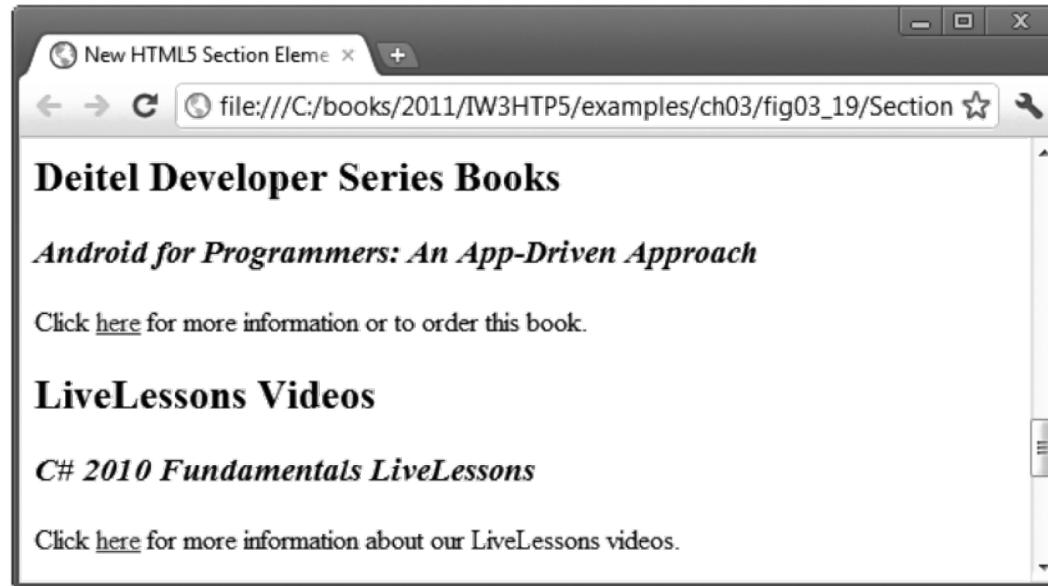

Fig. 3.18 | New HTML5 section elements. (Part 12 of 13.)

e) Chrome browser showing the last section containing a meter element, followed by a footer element

Fig. 3.18 | New HTML5 section elements. (Part 13 of 13.)

3.3.1 header Element

- ▶ The **header element** creates a header for this page that contains both text and graphics.
- ▶ The header element can be used multiple times on a page and can include HTML headings (<h1> through <h6>), navigation, images and logos and more.

time Element

- ▶ The **time element**, which does not need to be enclosed in a header, enables you to identify a date (as we do here), a time or both.

3.3.2 nav Element

- ▶ The **nav element** groups navigation links.
- ▶ In this example, we used the heading Recent Publications and created a **ul** element with seven **li** elements that link to the corresponding web pages for each book.

3.3.3 figure Element and figcaption Element

- ▶ The **figure element** describes a figure (such as an image, chart or table) in the document so that it could be moved to the side of the page or to another page.
- ▶ The **figcaption element** provides a caption for the image in the **figure element**.

3.3.4 article Element

- ▶ The **article** element describes standalone content that could potentially be used or distributed elsewhere, such as a news article, forum post or blog entry.
- ▶ You can nest **article** elements. For example, you might have reader comments about a magazine nested as an **article** within the magazine **article**.

3.3.5 summary Element and details

Element

- ▶ The **summary element** displays a right-pointing arrow next to a summary or caption when the document is rendered in a browser (Fig. 3.19).
- ▶ When clicked, the arrow points downward and reveals the content in the **details element**.

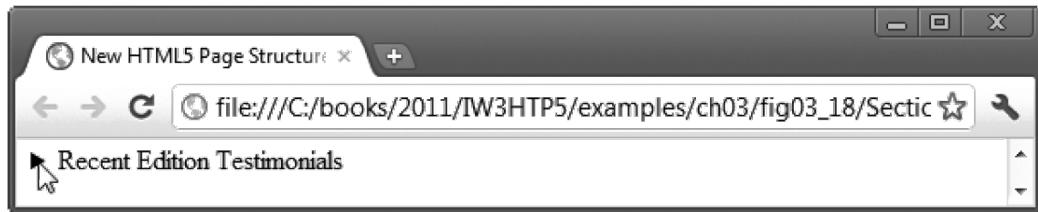

Fig. 3.19 | Demonstrating the summary and detail elements.
(Part 1 of 2.)

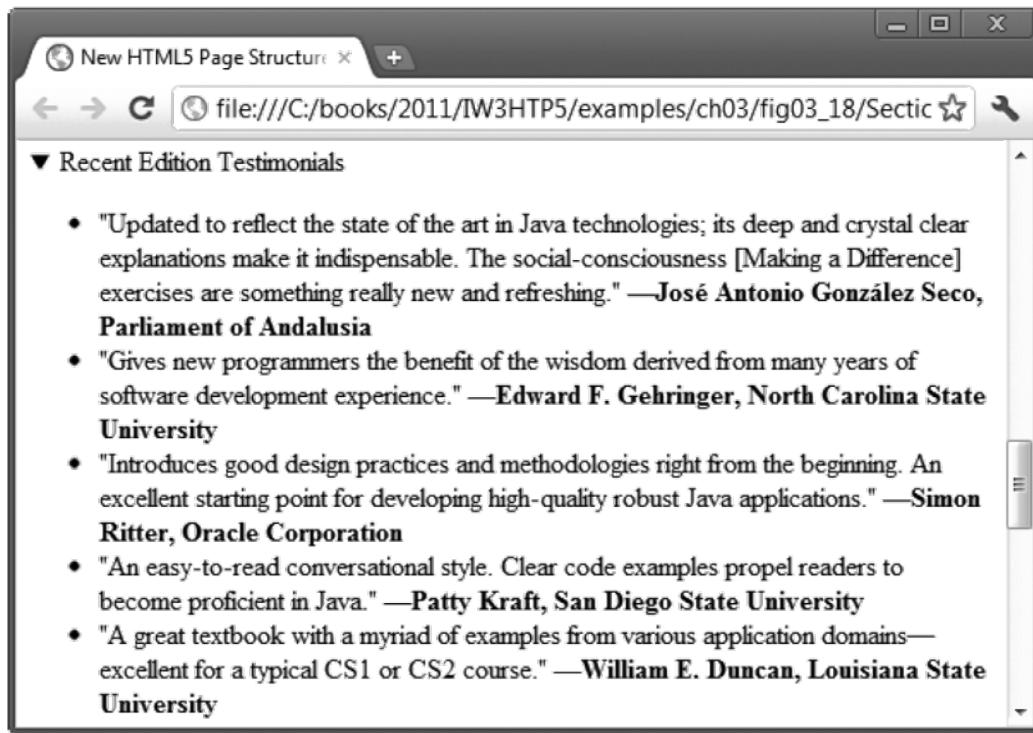

Fig. 3.19 | Demonstrating the summary and detail elements.
(Part 2 of 2.)

3.3.6 section Element

- ▶ The **section element** describes a section of a document, usually with a heading for each section—these elements can be nested.
- ▶ In this example, we broke the document into three sections—the first is Recent Publications.
- ▶ The section element may also be nested in an article.

3.3.7 aside Element

- ▶ The **aside element** describes content that's related to the surrounding content (such as an article) but is somewhat separate from the flow of the text.
- ▶ For example, an aside in a news story might include some background history.

3.3.8 meter Element

- ▶ The **meter element** renders a visual representation of a measure within a range (Fig. 3.20).
- ▶ In this example, we show the results of a recent web survey we did.
- ▶ The `min` attribute is "0" and a `max` attribute is "54" —indicating the total number of responses to our survey.
- ▶ The `value` attribute is "14", representing the total number of people who responded "yes" to our survey question.

Fig. 3.20 | Chrome rendering the meter element.

3.3.9 footer Element

- ▶ The **footer element** describes a *footer*—content that usually appears at the bottom of the content or section element.
- ▶ In this example, we use the footer to describe the copyright notice and contact information.

3.3.10 Text-Level Semantics: mark Element and wbr Element

- ▶ The **mark element** highlights the text that's enclosed in the element.
- ▶ The **wbr element** indicates the appropriate place to break a word when the text wraps to multiple lines.
- ▶ You might use wbr to prevent a word from breaking in an awkward place.
